

Fillmore and Piru Basins Groundwater Sustainability Agency

FPBGSA Stakeholder Workshop Groundwater Model Overview

Senior Groundwater Modeler

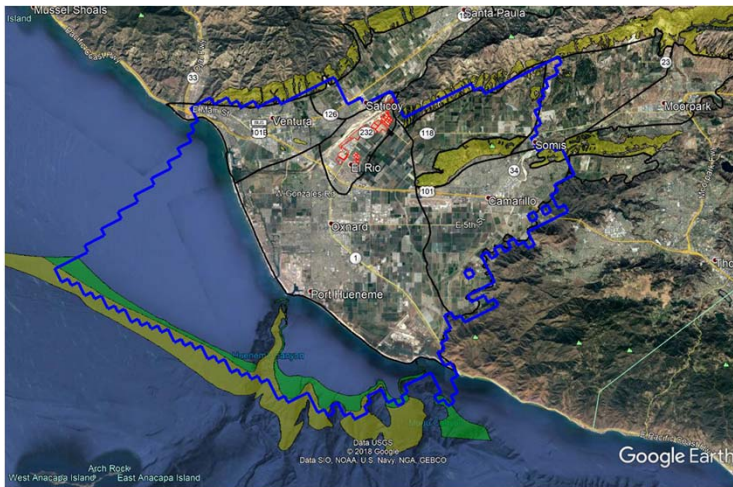

Jason Sun, PhD, PE

June 25, 2020

1

The UWCD Groundwater Model in 2018

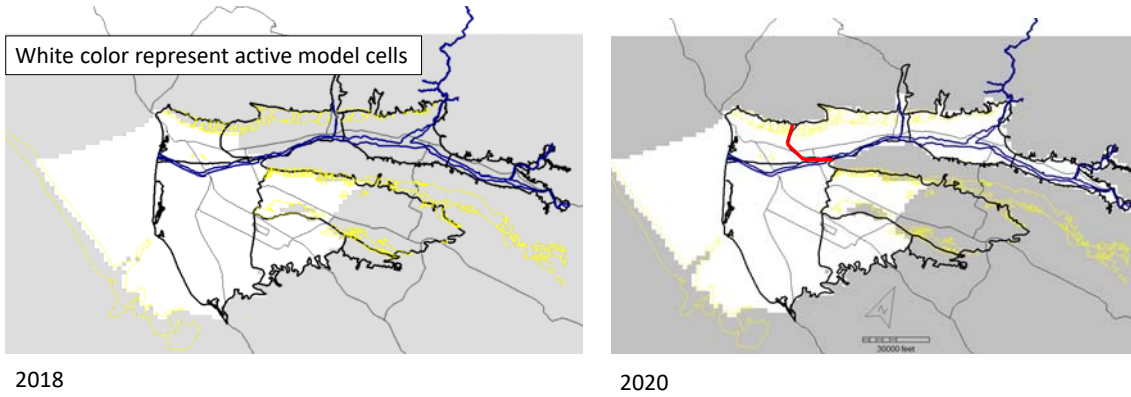

- Started in 2013 for UWCD groundwater management
- After SGMA was passed in 2014, the UWCD Model was considered an ideal tool to support local GSAs
- UWCD released the GW model in 2018 and was used to simulate FCGMA's GSPs
- The 2018 model domain is shown in **BLUE**.

2

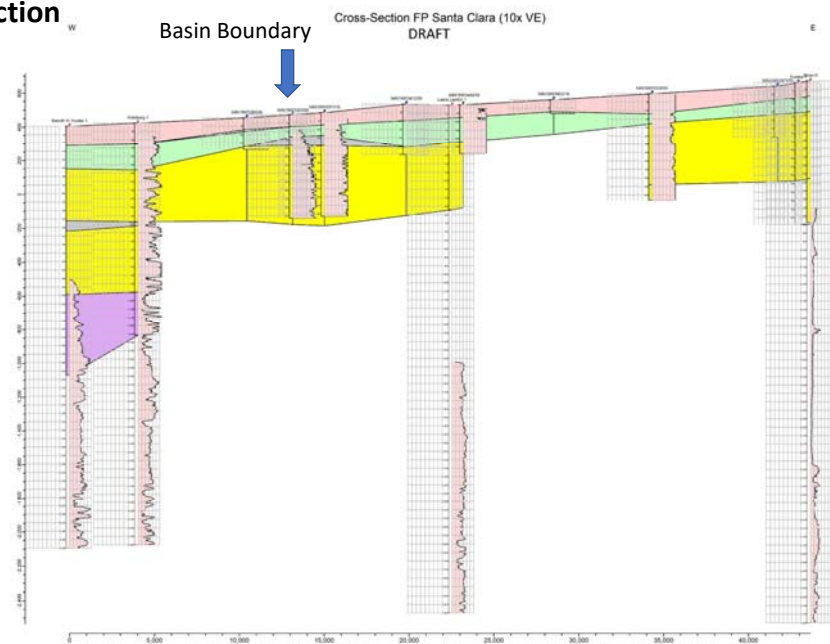

Model Expansion

- The 2018 GW model is expanded into **Santa Paula, Fillmore and Piru** Basins
- The 2018 GW model also extends in **Mound** basin to the DWR basin boundary
- The geology changes from Forebay to Santa Paula along Country Club Fault and Oak Ridge Fault (in **RED line**)

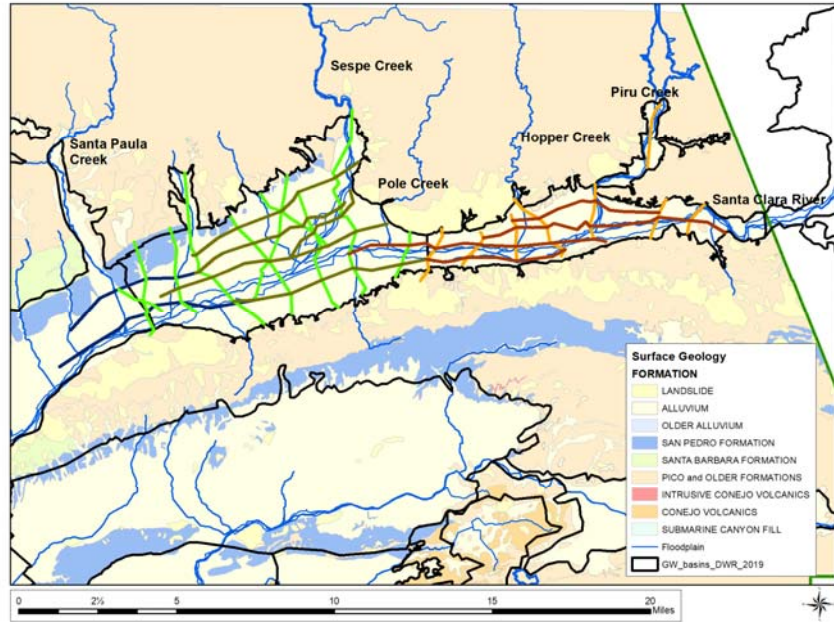

3

Example Section

4

Section lines in the Piru and Fillmore basins

5

Mapping of hydrostratigraphic units (aquifers)

Aquifer System	Hydrostratigraphic Unit	Model Layers
A	Surficial Deposits and Colluvium	1
	Aquitard	2
	Recent River Alluvium	3
B	Aquitard	4
	Older Alluvium	5
	Aquitard	6
C	Upper Saugus	7
	Aquitard	8
	Lower Saugus	9
	Undifferentiated Sedimentary Deposits	10

6

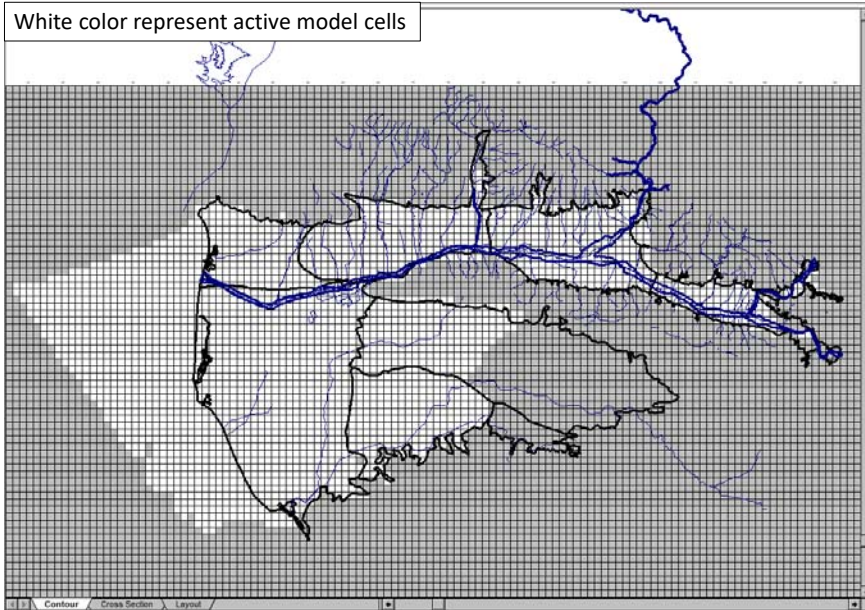

UWCD Groundwater Model

- **MODFLOW-NWT** Version 1.2.0 – a well documented and reviewed software developed by U.S.G.S.
- **Grid size: 2000 ft by 2000 ft.** The CPU time is about 25 minutes. For finer grids (1000 ft or 500 ft), the CPU time (about 8 or 16 hours) is too long
- **Simulation time: 1985 to 2015 with monthly time step**
- **Pumping:** Ag and M&I usages
- **Streams:** Santa Clara River, Piru Creek, Hopper Creek, Pole Creek, Sespe Creek, Santa Paula Creek, UWCD conservation releases
- **Diversions:** Various diversions along Santa Clara River, Piru Creek, and Santa Paula Creek
- **Surface water:** Recharge from **precipitation**, Ag/M&I usages
- **Validation period: 2016 to 2019** (future task)

7

The figure below is for illustration purpose.

White color represent active model cells

- Model rotated 26°
- 26505 active cells
- 384.7 mile²

Basin	Monitoring Wells	Pumping Wells
All Basins	888	1607
Oxnard Plain + Forebay	442	642
Fillmore	104	363
Piru	51	125

8

Why Use the Groundwater Model?

- Available data like water level are points over a vast area. A groundwater model can **connect the dots based on good science**
- Predict the water level due to
 - Climate changes, future conditions, and rain fall patterns
 - Projects: imported water, conservation releases
 - Management decisions
- Support the analysis of GSPs including
 - Groundwater level at key areas for MT, MO
 - Environmental effects

9

Model Calibration

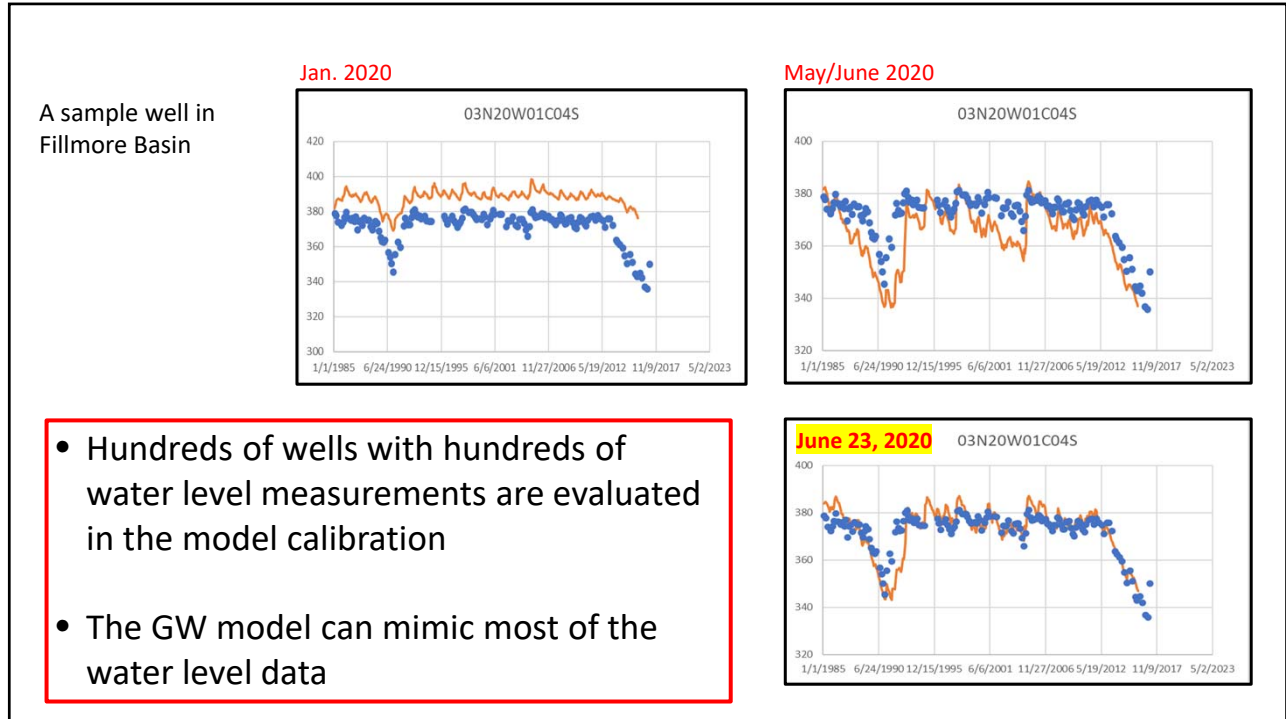

- The closer the simulated values (in **orange**) are to the data (in **blue**), the better the model.
- Adjust aquifer properties, stream bed properties,... so that the model replicates the data

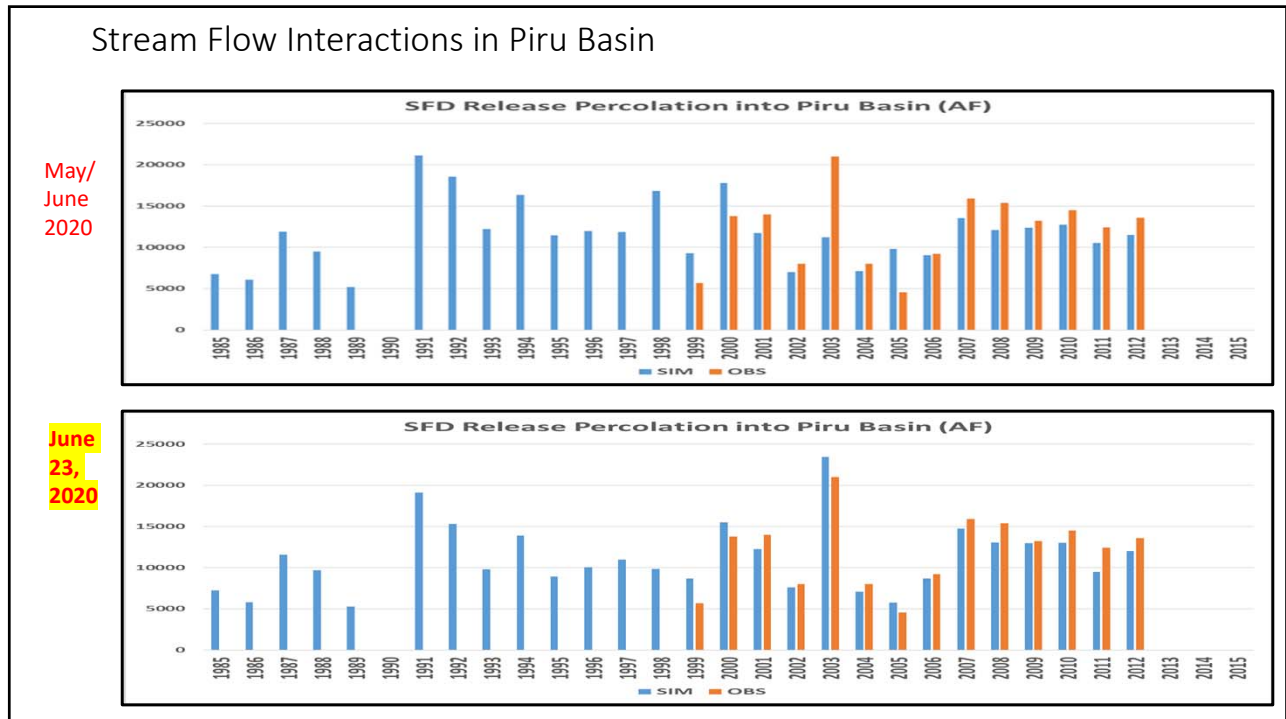

A sample well in Piru Basin

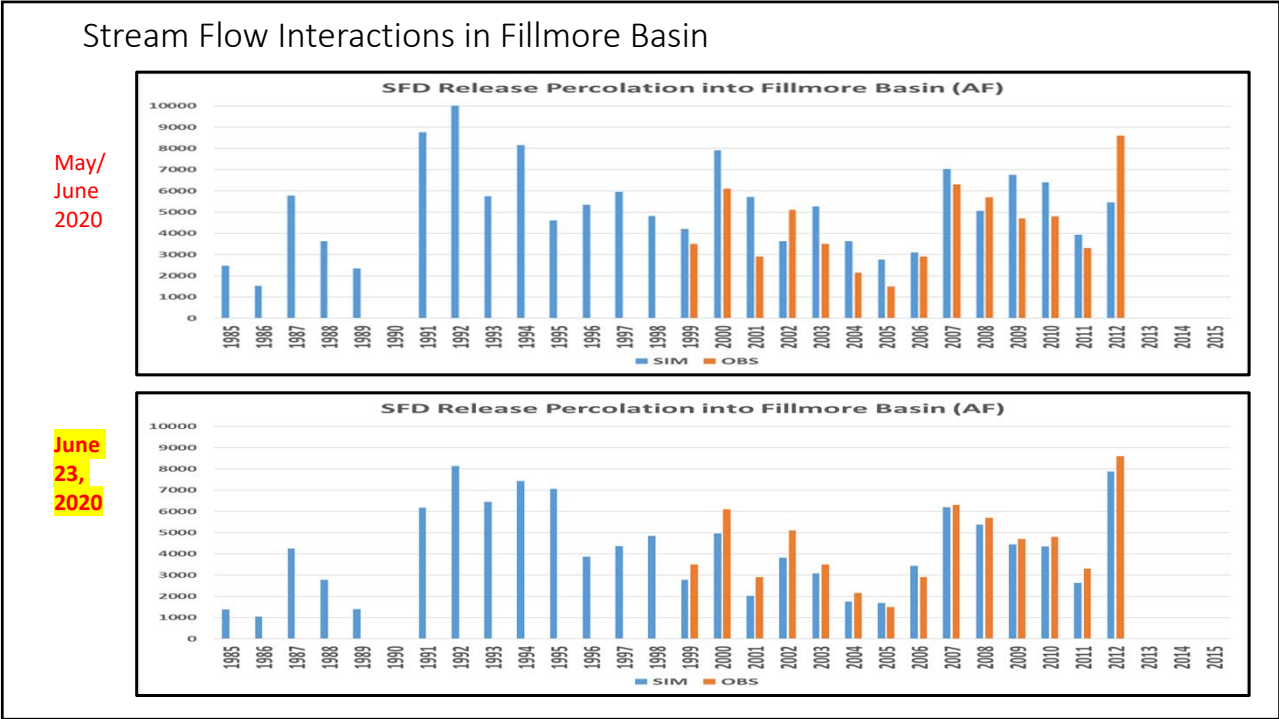

10

11

12

13

Model Review

- The 2020 groundwater model has been reviewed by the expert panel (Dr. Sorab Panday, Mr. John Porcello, and Mr. Jim Rumbaugh) on a continuous basis. The same panel had reviewed the 2018 model
- The model is under internal review by surface water hydrologists and hydrogeologists
- UWCD is addressing the review comments and finalizing the 2020 groundwater model

14

Questions/Comments

16

Model Layers

The hydrogeologists completed the mapping of hydrostratigraphic units (aquifers) in 2019

Coastal Basins (Oxnard Basin, PV, Mound, and West LP)			River Basins (Santa Paula, Fillmore, and Piru)		
Aquifer System	Hydrostratigraphic Unit	Model Layer	Aquifer System	Hydrostratigraphic Unit	Model Layer
Shallow	Ground Surface to the bottom of Semi-Perched Aquifer	1			
UAS	Semi Perched-Oxnard Aquitard	2	A	Surficial Deposits and Colluvium	1
	Oxnard Aquifer	3		Aquitard	2
	Oxnard-Mugu Aquitard	4		Recent River Alluvium	3
	Mugu Aquifer	5	B	Aquitard	4
Mugu-Hueneme Aquitard	6	Older Alluvium		5	
Hueneme Aquifer	7	Aquitard		6	
LAS	Hueneme-Fox Canyon Aquitard	8	C	Upper Saugus	7
	Fox Canyon Aquifer - upper	9		Aquitard	8
	Fox Canyon upper - basal Aquitard	10	Lower Saugus	9	
	Fox Canyon Aquifer - basal	11	Undifferentiated Sedimentary Deposits	10	
	Santa Barbara and/or other Formation - upper	12			
	Grimes Canyon Aquifer	13			
Deep	Older sedimentary rocks and Conejo Volcanics	Boundary			

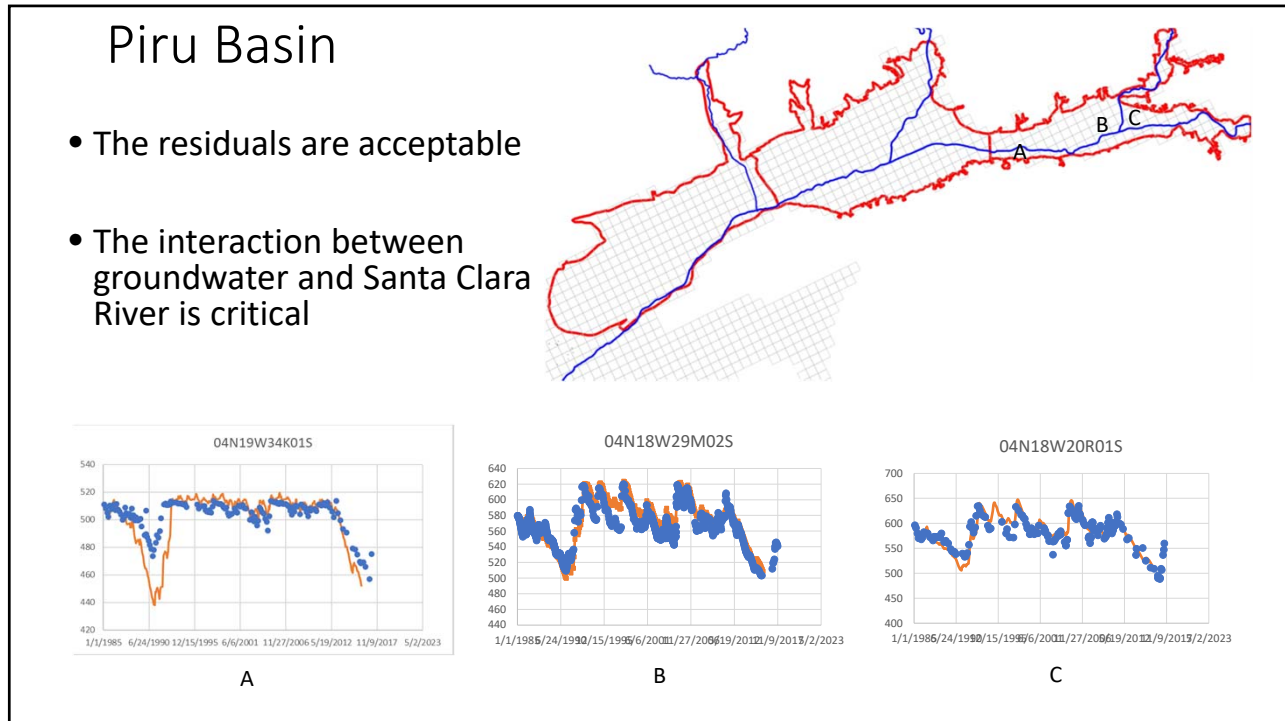

Fox Canyon Aquifer and Grimes do not extend into the River basins (Santa Paula, Fimmore and Piru)

17

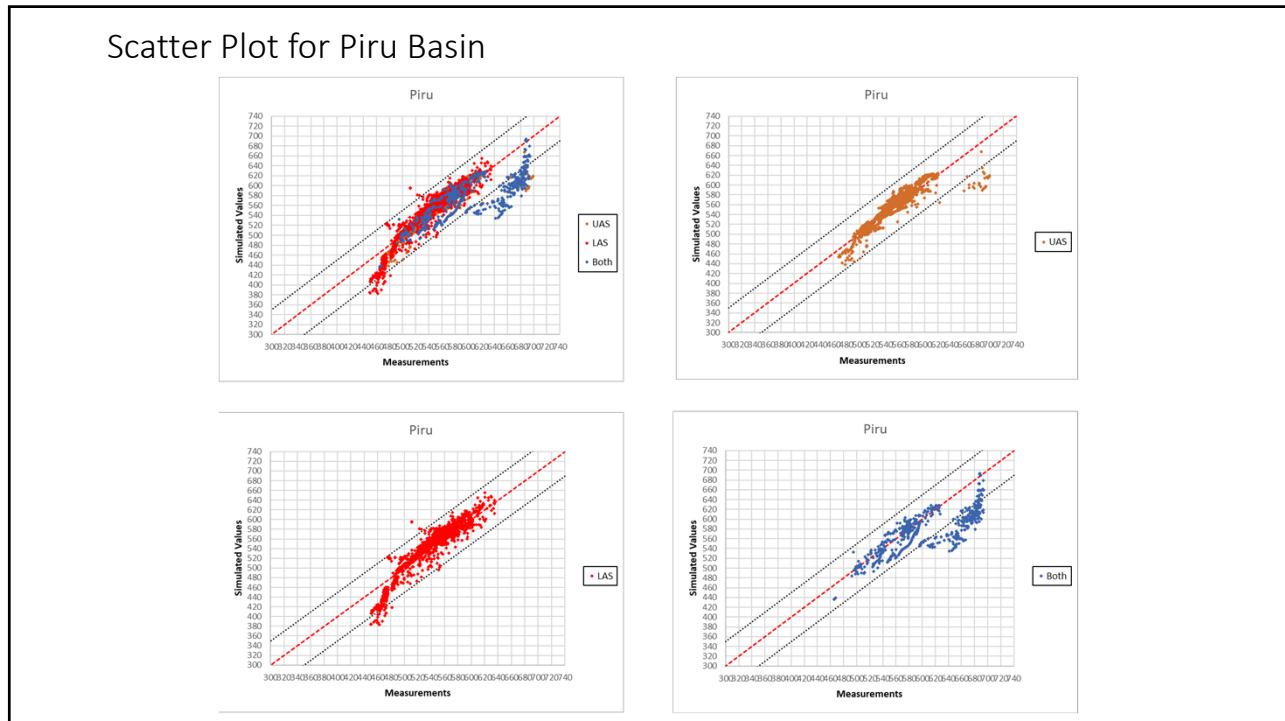

Model Calibration

- Forebay, Mound, Oxnard Plain, PV, and West LP were calibrated in the 2018 UWCD Model
- Piru, Fillmore, and Santa Paula basins are new
- The interaction between surface water and groundwater is critical for model calibration

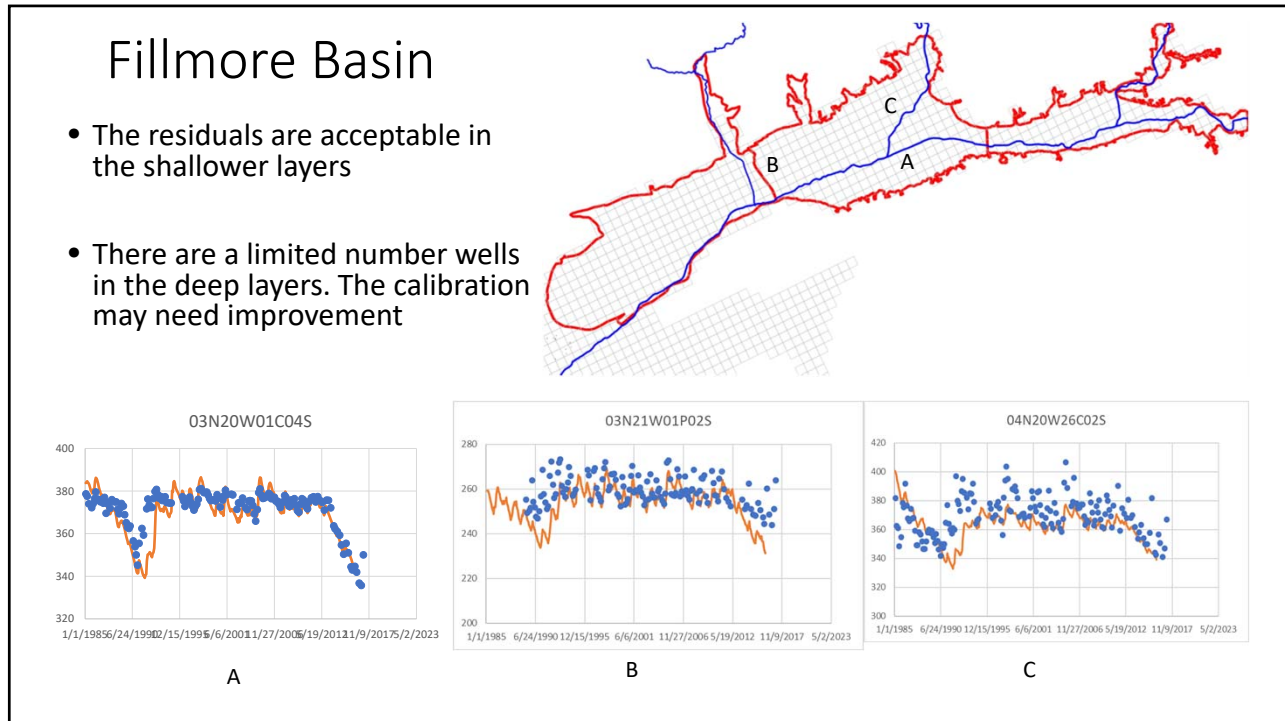

18

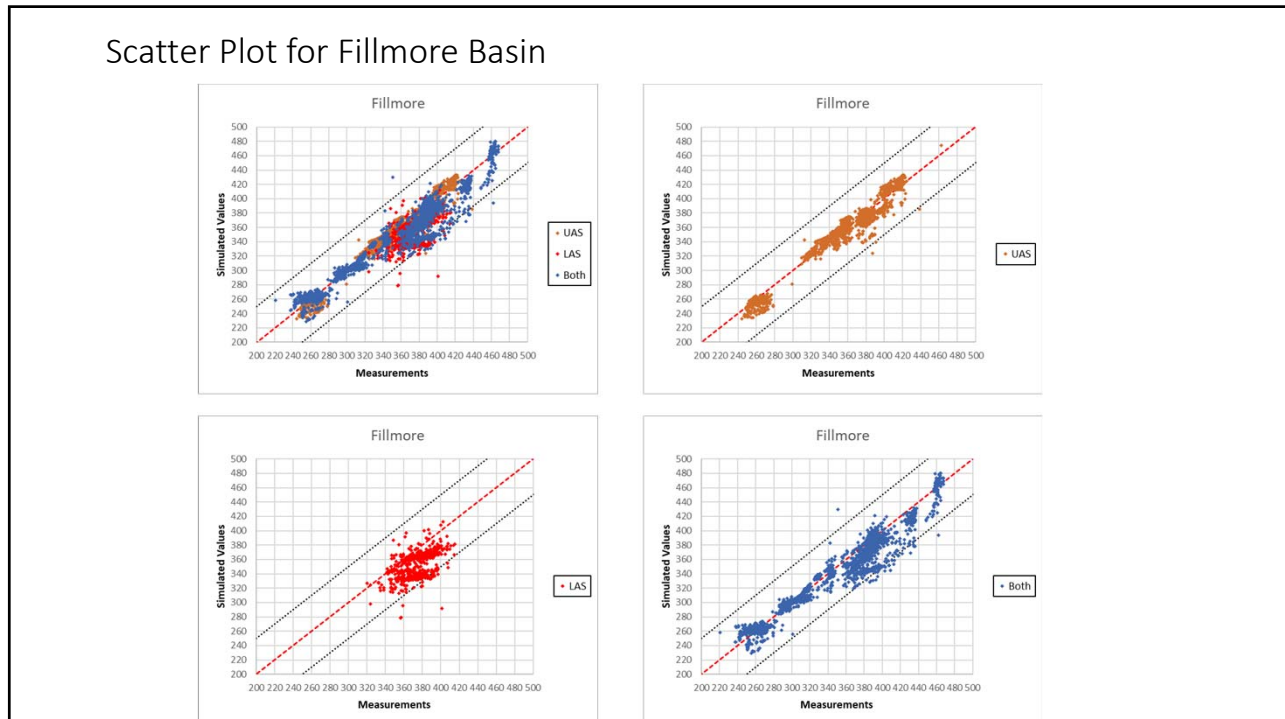

19

20

21

22

Santa Paula Basin

- The water level data is generally flat
- The residuals are acceptable
